

LRC FILE EDITOR - USER MANUAL

LRC Checker System • HTML Report & Interactive Synchronization Editor

1. System Overview & Core Workflow

The **LRC Checker Utility** is a Docker-based system designed to audit, organize, synchronize, and verify synchronized lyric files (.lrc) across large digital audio collections. The application operates through two interconnected components: an **HTML Status Report** (lrc_report.html) for high-level collection analysis and a dedicated **Interactive LRC Editor** for fine-grained timestamp adjustment, text editing, and verification.

Phase	Action	Key Tool / Component	Expected Outcome
1. Audit	Scan audio library and view global statistics.	HTML Report (rec-cat.png)	Identifies missing, unsynched, or corrupt .lrc files.
2. Filter	Isolate tracks by error status (e.g., Missing, Desync).	Status Filter Bar	Presents a clean subset of tracks needing attention.
3. Edit	Click 'EDITAR' to launch the web editor.	LRC Interactive Editor	Loads audio player, timestamp list, and lyric search.
4. Sync	Press Enter or paste text to match lyrics with audio.	Keyboard Shortcut & Player	Aligns line timestamps to exact playback moments.
5. Finalize	Save changes and mark track as Signed or Instrumental.	Global Action Toolbar	Updates file on disk, creates backup, updates report.

Figure 1: Quality control audit dashboard displaying category breakdown and valid coverage metrics.

2. HTML Report Navigation & Category Filters

The lrc_report.html file provides an interactive dashboard listing all scanned music albums and tracks. At the top of the report, status summary counters allow instant filtering across the entire library:

Validation Status	System Meaning & Description	Recommended Action
OK	The .lrc file exists, is properly formatted, and synchronized.	No action required.

Missing (Sin .lrc)	No .lrc file exists for the corresponding audio file.	Click EDITAR, search/paste lyrics, and synchronize.
Empty (.lrc vacío)	The file exists but contains no text or timestamps.	Paste lyrics or designate track as instrumental.
Unsynced / Desync	Timestamps exist but show severe offset relative to track duration.	Open editor and adjust timing or use 'Shift All'.
Review (Revisar)	Moderate timing variance requiring manual visual check.	Listen to audio in editor to confirm alignment.
Instrumental	Track is designated as an instrumental musical piece.	Contains 'This song is an instrumental' tag.
Signed (Firmado)	Manually verified and stamped by a human reviewer.	Protected state; verified accurate.

3. Interactive LRC Editor Interface Layout

Clicking the **EDITAR** button in the HTML report opens the interactive editor in a dedicated window, passing parameters via URL (e.g., /editor?audio=/path/song.mp3&lrc;=/path/song.lrc&tema;=Song+Title). The interface concentrates all necessary editing tools into a single streamlined view:

Header & Audio Player: Shows song title, full file system paths, verification badge ([Unsigned] or [Signed]), and an unsaved changes indicator (● unsaved changes). Built-in HTML5 player controls playback.

Global Action Toolbar: Provides one-click access to critical file management actions.

Control Button	Keyboard / Input	Functional Description & Technical Operation
Save (Guardar)	Click / Ctrl+S	Writes updated .lrc file to disk, creates an automatic backup, re-analyzes file, and updates report status.
Sign (Firmar)	Click	Appends the digital verification marker (e.g., Oct4vyus Kandle) certifying manual human audit.
Mark Instrumental	Click	Inserts 'This song is an instrumental' tag, marking the track as instrumental to prevent empty-file warnings.
Shift All (Desplazar todo)	Numeric Input (sec)	Applies a uniform offset in seconds to ALL timestamps in the file. Supports positive (+2.5s) or negative (-1.2s) shifts.
Undo (Deshacer)	Click	Reverts the last timing adjustment, line deletion, or text change performed during the active editing session.
Reload (Recargar)	Click	Discards unsaved in-memory edits and re-reads the physical .lrc file stored on the server.

4. External Lyric Search & Multi-Line Clipboard Paste

When creating lyrics for a track marked as *Missing* or replacing incomplete text, the editor offers two fast input channels:

A. External Search Engines: Enter the song title or artist in the search box and click **LETRAS**, **GENIUS**, or **MÚSICA.COM** to query external web providers directly.

Figure 4: Web lyric search bar with direct platform query buttons.

B. Smart Multi-Line Clipboard Paste (Key Feature):

When you copy multiple lines of lyrics from an external website or text document into your system clipboard, you can paste them directly into any text input field in the editor list using **Ctrl + V**. The editor automatically parses the multi-line text block, splits it by line breaks, and inserts each phrase into individual sequential rows starting from the current cursor position. All surrounding timestamps and existing text rows are cleanly preserved, allowing you to prepare complete song lyrics in seconds before starting audio playback synchronization.

KEY FEATURE: Pasting multi-line text into an active row immediately creates dedicated line entries for each copied phrase. You do not need to manually add rows one by one before pasting.

5. File Header Metadata & Line-by-Line Synchronization

Optional File Metadata Panel: Expandable section at the top of the editor allows defining standard .lrc header tags read by media players like Jellyfin, Navidrome, and Symfonium:

Figure 5: File metadata header tags ([ti: Title], [ar: Artist], [al: Album], [length: Duration]).

Live Line Synchronization Procedure (Recommended Method):

1. Start audio playback using the HTML5 media player.
2. Click inside the text input box of the first lyric phrase.
3. At the exact instant the vocals for that phrase begin in the song, press the **Enter** key.
4. **Automatic System Effect:** The editor captures the precise audio playback time in milliseconds, assigns it as the line's timestamp, and automatically advances input focus to the subsequent line.
5. Continue pressing **Enter** as each phrase is sung throughout the song.

Figure 6: Live keyboard synchronization using the Enter key to capture timestamps seamlessly.

Per-Line Row Controls:

Icon / Button	Action Name	Operation & Purpose
⏮	Play from Point	Seeks audio playback instantly to the exact timestamp of that specific line to verify vocal alignment.
↑ / ↓ (+ / -)	Fine Adjustment	Increments or decrements the timestamp by fractional seconds for precision micro-tuning.
⏸	Capture Time	Grabs current audio playback time and updates active row timestamp without advancing cursor focus.
⏹	Delete Row	Removes the lyric text and its associated timestamp from the file.
+	Add Row	Inserts a new empty lyric line directly below the active row.

6. Operational Scenarios & Best Practices

Scenario A: Processing a Missing .lrc Track

1. Filter by *Missing* in the HTML report and click **EDITAR**.
2. Fetch lyrics using external search or paste text from clipboard.
3. Play audio and synchronize line-by-line pressing **Enter**.
4. Click **Save**, then click **Sign** to finalize verification.

Scenario B: Correcting a Desynchronized File

1. Open track in editor and listen to check if offset is uniform.
2. If offset is constant across entire track, enter offset seconds and click **Shift All**.
3. If offset affects only isolated stanzas, re-capture timestamps using **Enter** or **↵**.
4. Verify final stanza against audio length, click **Save** and **Sign**.

Scenario C: Handling Instrumental Tracks

1. Open audio track in editor.
2. Click **Mark Instrumental** in the toolbar.
3. Click **Save**. The system classifies it as *INSTRUMENTAL* in reports, preventing empty file errors.

QUALITY CONTROL: Crucial Best Practice: Always inspect the timestamp of the final lyric line against total track duration before closing the editor. Never exit the editor while the header displays '● unsaved changes'.
